API Reference

This page lists every endpoint available to a [Personal API Token](#) — auto-generated from the backend's route definitions, so it always matches what's actually deployed. Every request must carry both required headers:

```
Authorization: Bearer smv_live_...
x-api-key: <your API key>
```

See [API Access](#) for how to generate a token, and for rate limits and quotas.

Response bodies are not yet documented here — every endpoint below shows the request shape (if any); the shape of a successful response isn't part of this generated reference yet. A [standalone PDF](#) of this page is also available.
